Handling and Fastening Specifications

The information shown are suggestions or guidelines and are not intended to cover all applications or building requirements. It is the responsibility of the designer/installer to ensure that this information meets particular building conditions and/or code requirements. It is also the responsibility of the installer to ensure that all OSHA and/or safety requirements are understood and met. Tremco Roofing and Building Maintenance shall not be liable for any claim or claims which arise out of the handling or installation of the material.

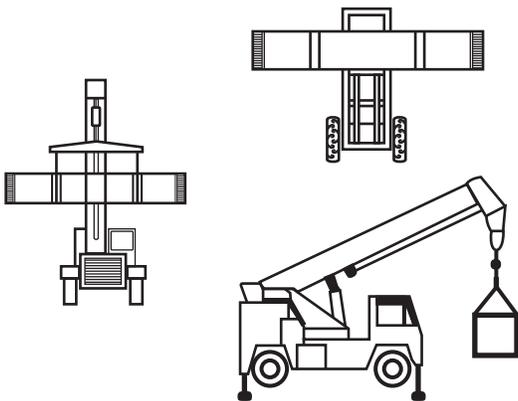

GENERAL HANDLING

When handling metal panels, care should be taken to protect the finish from scratching or abrasion. Dragging panels across one another will unnecessarily increase the risk of scratching. Individual panels should be carried vertical to the ground by grasping the edge of the panel.

MECHANICAL HANDLING

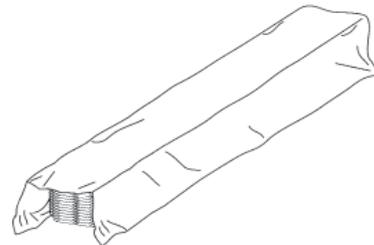

A forklift or crane can be used to handle unopened bundles up to 25' in length. For forklift unloading, forks should be spread to maximum width and placed at center line weight distribution of bundle. For crane unloading, a spreader bar should be used to evenly distribute the weight of the bundle. Cable supports will cause damage to the panels and should not be used.

STORAGE AND PROTECTION

Bundled material should be kept dry and above ground. Material should be tarped (not with plastic) or protected from weather conditions by other means. Allow for proper air circulation to prevent moisture buildup under tarp. Elevate one end of the bundles to allow for moisture runoff. If the panels become wet, all panels should be removed from bundles and individually dried.

Prolonged storage of panels is not recommended. If conditions do not permit immediate installation, extra care should be taken to protect sheets from developing white/red rust or watermarks.

PANEL INSPECTION

All bundles of panels should be inspected upon delivery from Tremco Roofing and Building Maintenance. Any damage or moisture present on panels should be reported to carrier and noted on bill of lading. In addition, Tremco Roofing and Building Maintenance must be notified of damage or moisture within 48 hours of discovery.

FIELD CUTTING

Some field cutting and fitting of panels is to be expected by the installer and minor field corrections are a part of normal installation work. Always cut one panel at a time. For small cuts, hand-held shears or electric nibblers are recommended. For best cutting results a panel shear is recommended. Shears and nibblers are available through Tremco Roofing and Building Maintenance. Cutting of panels and driving of fasteners will create metal shavings. These metal shavings must be swept or removed from the panel surface. Failure to do so will cause rust stains on the panel surface and will void any warranty.

SAMPLE CALCULATIONS FOR ROOF PANEL

SYMBOL

A. SELECT PANEL FOR DEAD + LIVE LOAD

REQUIRED INFORMATION:

Purlin Spacing (FT) SPAC
Live Load (PSF) LIVE
Panel Dead Load (PSF) DEAD
Span Length (FT)
Number of Spans

CALCULATE TOTAL LOAD (PSF) TOTAL

Total = Dead + Live

FIND THE ALLOWABLE LOAD IN THE LOAD TABLES LOAD

Use the continuous load tables for the number of spans, the panel gauge and the span length required. The value will be found under the heading Live. The trial panel is acceptable if LOAD is greater than or equal to the TOTAL.

B. CHECK THE TRIAL PANEL FOR WIND LOAD

REQUIRED INFORMATION:

Purlin Spacing (FT) - SPAC
Wind Load (PSF) WIND
Panel Dead Load (PSF) DEAD
Span Length (FT)
Number of Spans
Roof Uplift Coefficient RCOEF

CALCULATE TOTAL LOAD (PSF) TOTAL

Total = (WIND X RCOEF - DEAD)

FIND THE ALLOWABLE LOAD IN THE LOAD TABLES LOAD

Use the continuous load tables for the number of spans, the panel gauge and the span length required. The value will be found under the heading Negative Wind. The trial panel is acceptable if LOAD is greater than or equal to the TOTAL.

C. CHECK THE TRIAL PANEL FOR DEFLECTION

REQUIRED INFORMATION:

Purlin Spacing (FT) - SPAC
Deflection Requirement DR
Example - L/180 DR

CALCULATE ALLOWABLE DEFLECTION (IN) DA

USE TOTAL and enter tables under the deflection requirement. The trial panel is acceptable if LOAD is greater than or equal to TOTAL.

NUMERICAL EXAMPLE FOR ROOF PANEL

A. SELECT PANEL FOR DEAD + LIVE LOAD

The following values are assumed for the example

Live Load	20 PSF
Wind Load	20 PSF
Purlin Spacing	5.5 FT.
Number of Spans	4 (Uniform)
Deflection Limit	L/180
Trial Panel	Mega_Rib, 29 GA., 80 KSI Yield
Weight of Panel	.75 PSF from Panel Properties Table

CALCULATE TOTAL APPLIED LOAD

$$\text{Total} = .75 + 20 = 20.75 \text{ PSF}$$

FIND THE ALLOWABLE LOAD IN THE LOAD TABLE

From the load table for MEGA-RIB panel, continuous load tables, 4 span condition, 29 GA. and FY = 80, the values for load are:

SPAN	LOAD
5.5 ft.	38 PSF

Load = 38 PSF - This is greater than 20.75.
The trial panel is okay for DEAD + LIVE LOAD.

B. CHECK THE TRIAL PANEL FOR DEFLECTION

REQUIRED INFORMATION:

Distance Between Supports	5.5 ft.
Deflection Requirements	L/180
Value for Deflection From Load Table	

SPAN	DEFL
5.5 ft.	72 PSF

Load = 72 psf - This is greater than 20.75.
The trial panel is okay for Deflection.

C. CHECK THE TRIAL PANEL FOR WIND LOAD

REQUIRED INFORMATION:

Purlin Spacing	5.5 FT.
Wind Load	20 PSF
Panel Dead Load	.75 PSF
Number of Spans	4 (Uniform)
Roof Uplift Coefficient	1.2

CALCULATE THE NET UPLIFT

$$\text{TOTAL} = (20 \times 1.2 - .75) = 23.25 \text{ PSF}$$

FIND THE ALLOWABLE LOAD IN THE LOAD TABLE (SAME CONDITIONS AS IN "A")

SPAN
5.5 ft.

LOAD
47 PSF

It is conservative to use the value for the larger span.
Load = 47 PSF - This is greater than 23.25
The trial panel is okay for wind load.

SAMPLE CALCULATIONS FOR WALL PANEL

SYMBOL

A. SELECT PANEL FOR DEAD + WIND LOAD

REQUIRED INFORMATION:

Girt Spacing (FT)
Wind Load (PSF)
Wall Wind Coefficient
Number of Spans

SPAC
WIND
WCOEF

CALCULATE TOTAL LOAD (PSF)

Total = Wind x WCOEF

TOTAL

FIND THE ALLOWABLE LOAD IN THE LOAD TABLES

Use the continuous load tables for the number of spans, the panel gauge and the span length required. The value will be found under the heading Negative or Positive Wind. The trial panel is acceptable if LOAD is greater than or equal to the TOTAL.

LOAD

NUMERICAL EXAMPLE FOR WALL PANEL

A. CHECK TRIAL PANEL DEAD + WIND LOAD

The following values are assumed for this example:
Wind Load
Girt Spacing
Wall Wind Coefficient
Number of Panel Spans
Trial Panel

25 PSF
6 ft.
1.2
2 (Uniform)
Mega-Rib,
29 GA., 80
KSI Yield

CALCULATE TOTAL LOAD (PSF)

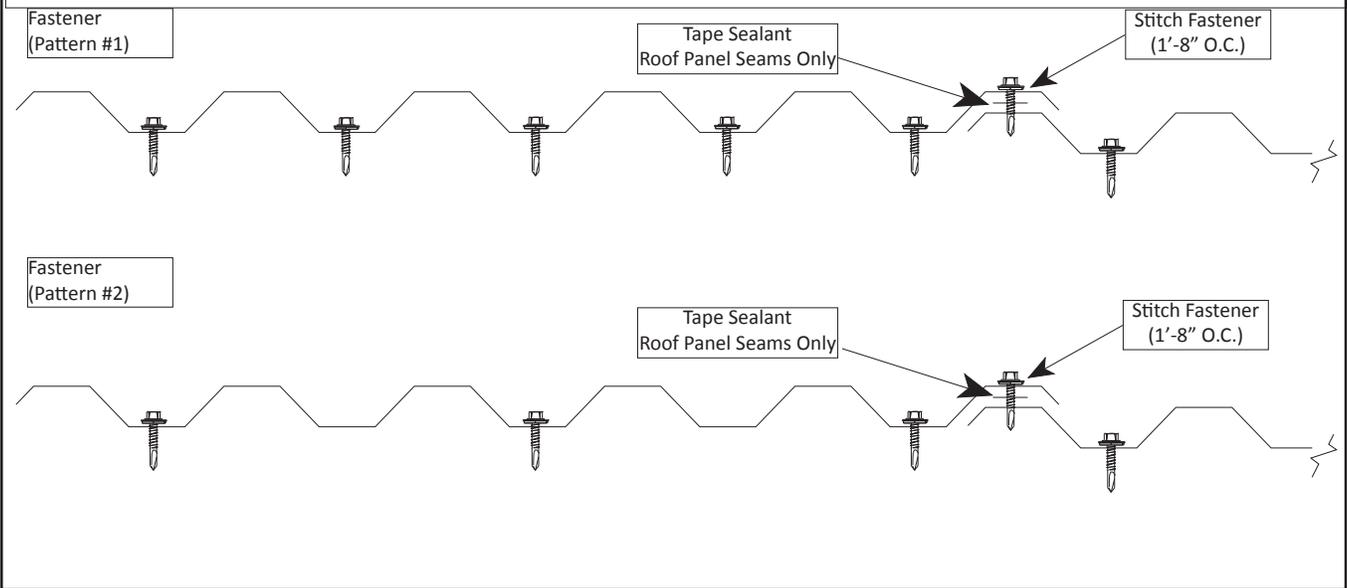

Total = 25 x 1.2 = 30 PSF

TOTAL

FIND THE ALLOWABLE LOAD IN THE LOAD TABLE

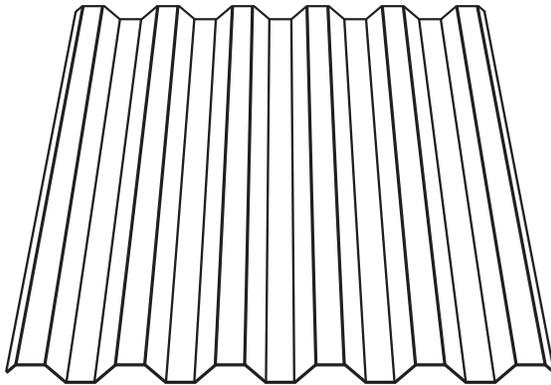

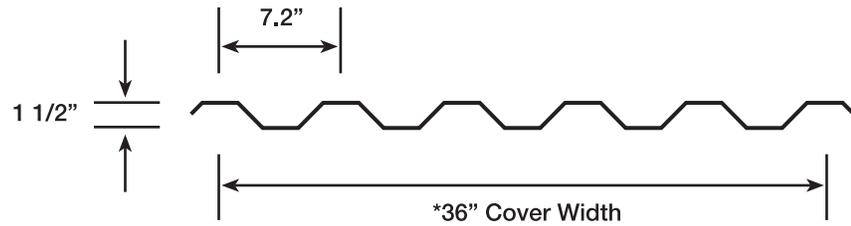

From the load table for MEGA-RIB panel, continuous load tables, 2 span condition, 29 GA. and FY = 80.
Load = 32 PSF - This is greater than 30.
The trial panel is okay for dead + wind load.

TremLock 7.2"

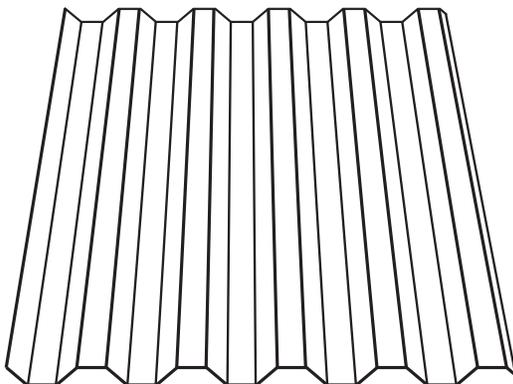

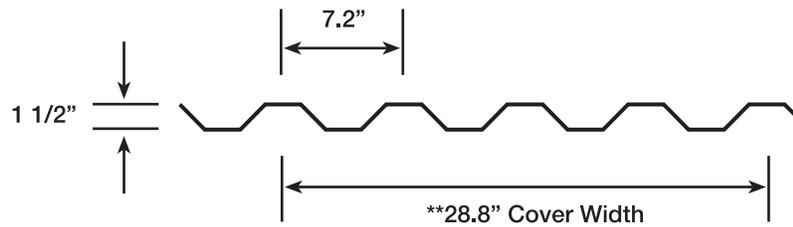

TremLock 7.2" Panel

PANEL PROFILES

* Standard for 29, 24, 22, 20, and 18 gauge material. Also available in 26 ga. However, customer must specify if 26 ga is required.

** Standard for 26 ga material.

TremLock 7.2" Panel

SECTION PROPERTIES AND LOAD TABLES

SECTION PROPERTIES						TOP IN COMPRESSION			BOTTOM IN COMPRESSION		
GAUGE	FY (KSI)	WEIGHT (PSF)	V _a kip/ft.	P _{a_end} lbs/ft.	P _{a_int} lbs/ft.	I _x (in. ⁴ /ft.)	S _e (in. ³ /ft.)	M _a kip-in./ft.	I _x (in. ⁴ /ft.)	S _e (in. ³ /ft.)	M _a kip-in./ft.

1. Section properties are calculated in accordance with the 2001 AISI North American Specification for the Design of Cold-Formed Steel Structural Members.
2. V_a is the allowable shear.
3. P_a is the allowable load for web crippling on end & interior supports. **MUST BE VERIFIED BY TESTS.**
4. I_x is for deflection determination.
5. S_e is for bending.
6. M_a is the allowable bending moment.
7. All values are for one foot of panel width.

Allowable Uniform Loads (PSF)

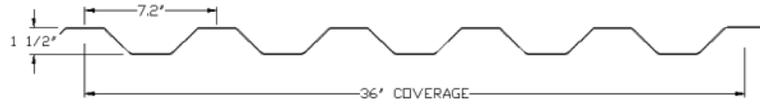

Span Type	Load Type	Span in Feet															
		1.50	2.00	2.50	3.00	3.50	4.00	4.50	5.00	5.50	6.00	6.50	7.00	7.50	8.00	8.50	9.00

Notes:

1. Allowable uniform loads are based upon equal span lengths.
2. Positive Wind is wind pressure and is **NOT** increased by 33 1/3 %.
3. Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3%.
4. Live is the allowable live or snow load.
5. Deflection (L/180) is the allowable load that limits the panel's deflection to L/180 while under positive or live load.
6. Deflection (L/240) is the allowable load that limits the panel's deflection to L/240 while under positive or live load.
7. The weight of the panel has **NOT** been deducted from the allowable loads.
8. Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
9. Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
10. Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.
11. Load tables are limited to a maximum allowable load of 500 psf.

1. Section properties are calculated in accordance with the 2001 AISI North American Specification for the Design of Cold-Formed Steel Structural Members.
2. V_a is the allowable shear.
3. P_a is the allowable load for web crippling on end & interior supports. **MUST BE VERIFIED BY TESTS.**
4. I_x is for deflection determination.
5. S_e is for bending.
6. M_a is the allowable bending moment.
7. All values are for one foot of panel width.

Notes:

1. Allowable uniform loads are based upon equal span lengths.
2. Positive Wind is wind pressure and is **NOT** increased by 33 1/3 %.
3. Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3%.
4. Live is the allowable live or snow load.
5. Deflection (L/180) is the allowable load that limits the panel's deflection to L/180 while under positive or live load.
6. Deflection (L/240) is the allowable load that limits the panel's deflection to L/240 while under positive or live load.
7. The weight of the panel has **NOT** been deducted from the allowable loads.
8. Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
9. Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
10. Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.
11. Load tables are limited to a maximum allowable load of 500 psf.

7. The weight of the panel has **NOT** been deducted from the allowable loads.
8. Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
9. Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
10. Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.
11. Load tables are limited to a maximum allowable load of 500 psf.

Notes:

1. Allowable uniform loads are based upon equal span lengths.
2. Positive Wind is wind pressure and is **NOT** increased by 33 1/3 %.
3. Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3%.
4. Live is the allowable live or snow load.
5. Deflection (L/180) is the allowable load that limits the panel's deflection to L/180 while under positive or live load.
6. Deflection (L/240) is the allowable load that limits the panel's deflection to L/240 while under positive or live load.
7. The weight of the panel has **NOT** been deducted from the allowable loads.
8. Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
9. Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
10. Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.
11. Load tables are limited to a maximum allowable load of 500 psf.

TremLock 7.2" Panel - Loading and Handling

UNLOADING:

ATTENTION:

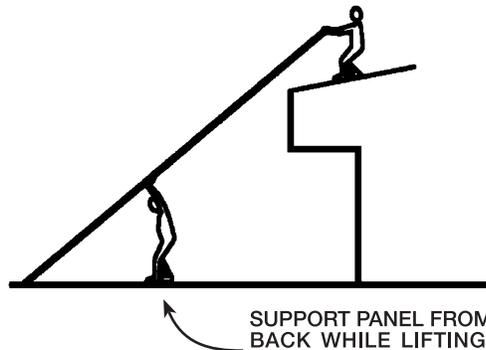

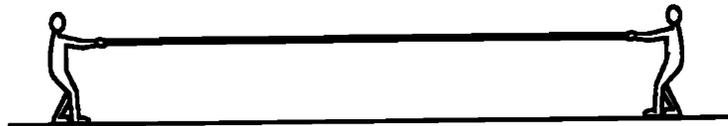

Improper unloading and handling of bundles may cause bodily injury or material damage. The manufacturer is not responsible for any bodily injuries or material damages that may happen during unloading and handling.

HANDLING BUNDLES:

Panel bundles less than 25 feet long may be unloaded with a forklift. The forklift should have at least five feet between forks, and panels should be picked up at their center of gravity. Extreme care must be taken when moving panels with a forklift.

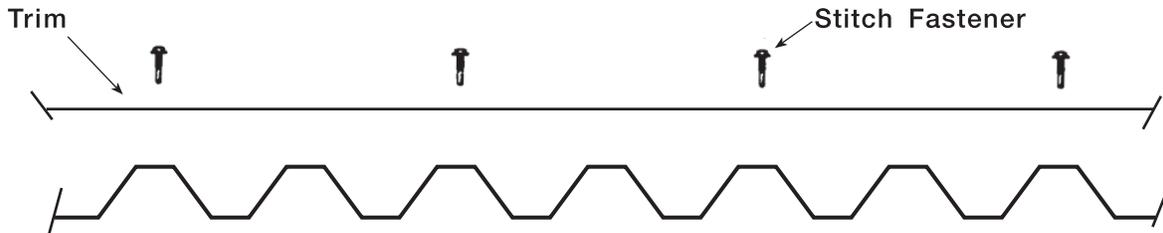

HANDLING SINGLE PANELS:

Panels need to be handled from ends, longer panels may need additional support in the center.

- Section properties are calculated in accordance with the 2001 AISI North American Specification for the Design of Cold-Formed Steel Structural Members.
- V_a is the allowable shear.
- P_a is the allowable load for web crippling on end & interior supports.
- I_x is for deflection determination.
- S_e is for bending.
- M_a is the allowable bending moment.
- All values are for one foot of panel width.

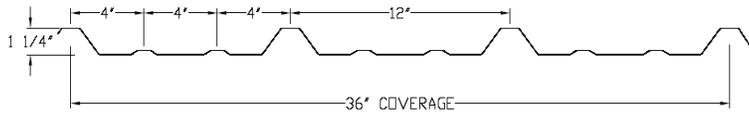

Allowable Uniform Loads (PSF)

Notes:

- Allowable uniform loads are based upon equal span lengths.
- Positive Wind is wind pressure and is **NOT** increased by 33 1/3 %.
- Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3 %.
- Live is the allowable live or snow load.
- Deflection (L/180) is the allowable load that limits the panel's deflection to L/180 while under positive or live load.
- Deflection (L/240) is the allowable load that limits the panel's deflection to L/240 while under positive or live load.
- The weight of the panel has **NOT** been deducted from the allowable loads.
- Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
- Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
- Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.

Notes:

- Allow able uniform loads are based upon equal span lengths.
- Positive Wind is wind pressure and is **NOT** increased by 33 1/3 %.
- Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3%.
- Live is the allow able live or snow load.
- Deflection (L/180) is the allow able load that limits the panel's deflection to L/180 while under positive or live load.
- Deflection (L/240) is the allow able load that limits the panel's deflection to L/240 while under positive or live load.
- The weight of the panel has **NOT** been deducted from the allow able loads.
- Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
- Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
- Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.

Notes:

- Allowable uniform loads are based upon equal span lengths.
- Positive Wind is wind pressure and is **NOT** increased by 33 1/3 %.
- Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3%.
- Live is the allow able live or snow load.
- Deflection (L/180) is the allow able load that limits the panel's deflection to L/180 while under positive or live load.
- Deflection (L/240) is the allow able load that limits the panel's deflection to L/240 while under positive or live load.
- The weight of the panel has **NOT** been deducted from the allow able loads.
- Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
- Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
- Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.

Notes:

- Allow able uniform loads are based upon equal span lengths.
- Positive Wind is w ind pressure and is **NOT** increased by 33 1/3 %.
- Negative Wind is w ind suction or uplift and is **NOT** increased by 33 1/3%.
- Live is the allow able live or snow load.
- Deflection (L/180) is the allow able load that limits the panel's deflection to L/180 w hile under positive or live load.
- Deflection (L/240) is the allow able load that limits the panel's deflection to L/240 w hile under positive or live load.
- The w eight of the panel has **NOT** been deducted from the allow able loads.
- Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
- Web crippling has not been checked for this panel.

Notes:

- Allow able uniform loads are based upon equal span lengths.
- Positive Wind is w ind pressure and is **NOT** increased by 33 1/3 %.
- Negative Wind is w ind suction or uplift and is **NOT** increased by 33 1/3%.
- Live is the allow able live or snow load.
- Deflection (L/180) is the allow able load that limits the panel's deflection to L/180 w hile under positive or live load.
- Deflection (L/240) is the allow able load that limits the panel's deflection to L/240 w hile under positive or live load.
- The weight of the panel has **NOT** been deducted from the allow able loads.
- Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
- Web crippling has not been checked for this panel.

Notes:

- Allowable uniform loads are based upon equal span lengths.
- Positive Wind is wind pressure and is **NOT** increased by 33 1/3 %.
- Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3%.
- Live is the allowable live or snow load.
- Deflection (L/180) is the allowable load that limits the panel's deflection to L/180 while under positive or live load.
- Deflection (L/240) is the allowable load that limits the panel's deflection to L/240 while under positive or live load.
- The weight of the panel has **NOT** been deducted from the allowable loads.
- Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
- Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".

- Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3%.
- Live is the allow able live or snow load.
- Deflection (L/180) is the allow able load that limits the panel's deflection to L/180 while under positive or live load.
- Deflection (L/240) is the allow able load that limits the panel's deflection to L/240 while under positive or live load.
- The weight of the panel has **NOT** been deducted from the allow able loads.
- Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
- Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
- Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.

Notes:

- Allow able uniform loads are based upon equal span lengths.
- Positive Wind is wind pressure and is **NOT** increased by 33 1/3 %.
- Negative Wind is wind suction or uplift and is **NOT** increased by 33 1/3%.
- Live is the allow able live or snow load.
- Deflection (L/180) is the allow able load that limits the panel's deflection to L/180 while under positive or live load.
- Deflection (L/240) is the allow able load that limits the panel's deflection to L/240 while under positive or live load.
- The weight of the panel has **NOT** been deducted from the allow able loads.
- Positive Wind, Negative Wind, and Live Load values are limited to combined shear & bending using Eq. C3.3.1-1 of the AISI Specification.
- Positive Wind and Live Load values are limited by web crippling using a bearing length of 2".
- Web crippling values are determined using a ratio of the uniform load **actually** supported by the top flanges of the section.

Tremlock R Plus Panel - Trim
